
Embedded Database Performance Report

Actian Zen more than 100x faster than SQLite and 10x faster data transfers with Zero ETL compared with SQLite to MySQL

MCG Global Services Benchmark Results

September 2021

ACTIAN™

Key insights

- This benchmark compared Actian Zen Edge Server and SQLite head-to-head as well as two instances of Zen Edge exchanging and synchronizing data vs. the combination of SQLite plus MySQL Enterprise to determine performance in client to server scenarios.

- Actian Zen Edge was faster across the board including the area where it really matters for embedded databases – write speed, over 100X faster!

- Actian Zen Edge (or any Zen family member) transferring data between instances of Zen has zero ETL penalty, as a result, in comparison to SQLite paired with MySQL, is over 10X faster in data transfer speed

Embedded Database Performance Benchmark

Product Profile and Evaluation: Actian Zen vs. SQLite and MySQL Enterprise

By William McKnight and Jake Dolezal
McKnight Consulting Group
August 2021

Sponsored by

Executive Overview

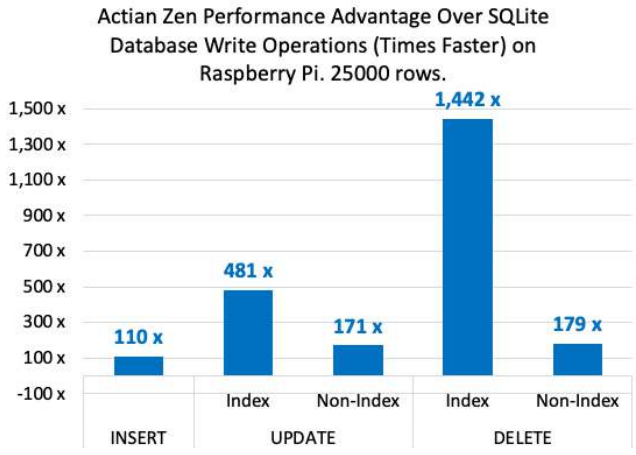
Embedded databases are built into software, transparent to the application's end user and require little or no ongoing maintenance. Embedded databases are growing in popularity with the rise of internet of things (IoT) giving innumerable devices robust capabilities via their own local database management system (DBMS). Developers can create sophisticated applications right on the IoT or remote device. For these uses, the embedded architecture is preferred over client-server approaches which rely on database servers accessed by client applications via interfaces. Today, to fully harness data to gain a competitive advantage, embedded databases need a high level of performance to provide real-time processing at scale.

To quantify embedded database performance, we conducted this benchmark study, which focuses on the performance of IoT-enabled, application-ready, relationally-based, embedded database solutions Actian Zen and SQLite syncing with MySQL Enterprise. The intent of the benchmark's design was to represent a set of basic database transactions that an organization developing edge applications might encounter.

The test methodology was based on and largely followed the Benchmark of Embedded Databases on .NET conducted in 2017 by Christophe Diericx; however, our own benchmark harness was developed. We conducted the benchmark on Zen Edge and SQLite installed on the same Raspberry Pi 3 device as well as an Android device. In our experience, performance is a very important aspect of an embedded database selection, but it is only one aspect and many factors should be considered.

Overall, the benchmark results were insightful in revealing the query execution performance of Actian Zen Edge and SQLite revealing some of the differentiators in the two products.

Actian Zen Edge was faster across the board including the area where it tends to really matter in embedded databases—write speed. This is the essential performance metric for IoT data. Actian Zen Edge outperformed SQLite on Raspberry Pi by 110x on inserts, 1,442 on deletes with an index, and 481x on updates with an index.



Actian Zen Edge outperformed SQLite on Android by 9x on inserts of 25,000 rows, 41x on deletes of 10,000 rows with an index and 29x on deletes without an index, and 363x on updates of 10,000 rows with an index and 464x of rows without.

Zen Edge took about the same time as SQLite to open and close rapid connections on Raspberry Pi.

In the “synchronization” benchmark, Actian Zen Edge outperformed SQLite by 14x on inserts of 25,000 rows, 26x on deletes of 10,000 rows with an index and 12x on deletes without an index, and 20x on updates of 10,000 rows with an index and 17x on updates of 5,000 rows without an index.

Actian Zen is a mature platform for embedded database applications with over 30 years of engineering and development behind it. Features that contributed to its extremely fast performance include, but are not limited to, the Btrieve API and Turbo Write Accelerator.

Embedded Database Selection

Organizations that utilize IoT and other application-laden smart devices rely on embedded database platforms to process edge data at high speed and bring it in with consistency to harmonize an ecosystem of activity. Volumes for data that can be utilized at the edge is rapidly expanding—placing significant performance demands on embedded architectures. Thus, a key differentiator is the depth by which a database maintains performance to scale with simple queries representative of real world use cases of embedded databases.

Both SQLite and Actian Zen were designed to "set it and forget it," with little-to-no ongoing database administration. However, Actian Zen was engineered purposefully to pare down an enterprise database platform to be embedded within OEM environments. SQLite was only designed as a step up from standard file systems. Therefore, Actian Zen has features that SQLite does not—including auto-reconnect networking, automated defragmentation, multi-user support, and concurrent write capabilities.

Both platforms offer SQL support. Actian Zen SQL is 100% ANSI SQL compliant. Additionally, Zen exclusively offers the high performance Btrieve 2 API (which is tested in this benchmark.) The Btrieve 2 API also supports NoSQL and native development support for Java and C/C++ and SWIG for Python, Perl, and PHP—in addition to its SQL support.

While the subject of this benchmark is embedded applications, Actian Zen Edge is part of the overall Zen family of Zen Edge, Zen Edge, Zen Enterprise, and Zen Reporting Engine. When combined, this suite of products enables not only embedded applications, but client-server (with zero ETL) and cloud deployments as well.

In a client-server configuration, Actian Zen also comes with the capability to move data in real time between Zen Edge or Edge on a remote device and Zen Enterprise on a server—without ETL. This capability is critical for today's needs and uses, because the potential number for embedded IoT devices, such as sensors, could easily number in the thousands, and all that information may need to funnel into a core database on a server. With the SQLite synchronization demands, having thousands of remote devices would overwhelm this architecture with table locks and the potential for lost data—making batch processing one's only option. Having the real time capability of Actian Zen Edge/Edge to Enterprise via the Btrieve API can allow you to achieve scale with simplicity.

Platform maturity is also a consideration. SQLite was initially released in 2000. Actian Zen was initially designed as Btrieve (and later PSQL) and has been in production with many multi-national organizations with over 30 years of engineering and enhancement.

This reports focuses on the performance of two embedded database options. It is important to get into the right embedded database early in the development cycle when the stakes are less critical. One is a specialty approach with enterprise software optimized for the embedded architecture, and

the latter an open source, multi-purpose database platform. Be aware of the options. Elite athletes don't get their pre-workout and electrolyte replenishment from the standard grocery aisle.

Benchmark Setup

The benchmark was executed using the following setup, environment, standards, and configurations.

Data Preparation

An aim of the benchmark is to simulate a typical real-world scenario and use case for embedded databases. In our benchmark, we chose a simple data model for an application that stores peoples' contact information in the embedded database. The model consists of one table, Contacts, described by the following:

Contacts
id integer
lastname varchar(25)
firstname varchar(25)
street varchar(30)
city varchar(30)
state varchar(2)
zip varchar(10)
country varchar(20)
phone varchar(13)

The data used in the benchmark was generated randomly in real time by the Python script during the benchmark execution. The columns city, state, and zip were used as selection criteria in the Select, Update, and Delete tests (described below). Therefore, a particular value was randomly seeded into this column during data generation to ensure there would be enough instances of that value to achieve the row counts required during the Select, Update, and Delete tests.

Configuration

Our benchmark included two different embedded RDBMS—Actian Zen Edge and SQLite—installed on the same Raspberry Pi 3 single board computer with a 64-bit quad core processor and the same Android device.

We also tested a client-server configuration with real-time synchronization. The server had both the latest versions of Actian Zen Enterprise and Oracle MySQL Enterprise RDBMS installed on the same machine. A simple ETL workload was developed with the test harness to move data from SQLite to MySQL Enterprise.

All components were deployed on a local area network.

Embedded (Client) RDBMS

Embedded RDBMS	Actian Zen Edge	SQLite
Version	14.21.004	3.36.0

Server RDBMS

Embedded RDBMS	Actian Zen Enterprise	Oracle MySQL Enteprise
Version	14.21.004	8.0.26

Raspberry Pi

Hardware	Raspberry Pi 3+
Processor	1x Broadcom BCM2837B0 SoC 1.4 GHz 64-bit quad-core ARM Cortex-A53 (512 KB shared L2 cache)
RAM	1 GB
OS	Raspbian GNU/Linux 9.4 (Stretch)

The Raspberry Pi is shown below.

Android Device

Hardware	Nokia 2 TA-1035 DS
Processor	1.3 GHz 64-bit quad-core ARM Cortex A7
RAM	1 GB (8 GB Storage)
OS	Android 7.1.1 Nougat

To the right is an image of the test harness developed in Android Studio.

Server

Hardware	Lenovo ThinkPad X1 Carbon G6 20BS006UUS x64-based PC
Processor	2x Intel Core i7-5600U @ 2.60GHz
RAM	8 GB
OS	Microsoft Windows 10 Enterprise 10.0.16299

Test Use Cases

As aforementioned, the test methodology was based on and largely followed the Benchmark of Embedded Databases on .NET conducted in 2017 by Christophe Diericx[1]. The test involves simple uses cases of the most basic RDBMS operations: open and closing connections and selecting, updating, and deleting rows based on indexed and non-indexed columns.

We considered other benchmark frameworks, such as the Transaction Performance Council (TPC). However, their test use cases were too complex and not very applicable to IoT and device applications. Most IoT devices and other applications will not require sophisticated RDBMS operations like multiple JOINs or subqueries. Therefore, we opted for tests that would demonstrate raw performance that could be found in most embedded database implementations.

Both RDBMS platforms support a robust set of SQL capabilities. For Actian Zen Edge we used the Btrieve API, rather than SQL, to execute the database transactions in order to test its functionality and performance.

Use Case 1: Open and Close Connections in Rapid Succession (Raspberry Pi only)

Some IoT device application will be developed to not keep a persistent connection to the database. Therefore, we were interested in seeing the performance of both RDBMS' ability to quickly connect and disconnect from the database in rapid succession.

For this, we had the benchmark test harness establish and close 250 connections to each RDBMS—one immediately after another.

Test 1	**Open and close 250 connections**

NOTE: We did not do this run for the Android device since it is standard practice for mobile developers to open a database connection and leave it open while the app is running. Also, we did not use this test for the client-server synchronization benchmark, having no applicable use for that workload.

Use Case 2: Insert Performance

IoT devices and other applications will undoubtedly need excellent insert performance. This may the single most important metric for many use cases. For example, consider an IoT device is a sensor taking readings at regular intervals. In the case of real-time or rapid sensor readings, insert performance is critical.

Test 2	**Insert 25,000 rows**

[1] The Benchmark of Embedded Databases on .NET found SQLite to be the fastest overall the platforms tested.

NOTE: At the beginning of the test, the database contains an empty Contacts table. The Insert test provides the test data for the remaining benchmarks.

Use Case 3: Select Performance

Certainly, we must consider both platforms' ability to retrieve data. Our test cases involve selecting bulk rows, rather than single rows via a unique identifier. The first variation of the test filters on an indexed column (state). The second test selects fewer rows, but filters on a column that does not have an index (zip).

Test 3a	**Select 10,000 rows on an indexed column**
Test 3b	**Select 5,000 rows on a non-indexed column**

NOTE: We did not use this test for the client-server synchronization benchmark, since selecting rows by themselves would not constitute the complete workload.

Use Case 4: Update Performance

We also tested the performance of bulk row updates using the same selection test criteria as Test 3. Our test cases involve selecting bulk rows and updating a single column. The first variation of the test filters on an indexed column (state) and updates zip. The second test selects fewer rows, but filters on a column that does not have an index (zip) and updates state.

Test 4a	**Update 10,000 rows on an indexed column**
Test 4b	**Update 5,000 rows on a non-indexed column**

Use Case 5: Delete Performance

We also tested the performance of bulk row deletes—again, using the same selection test criteria as Test 3. Our test cases involve selecting bulk rows and deleting them. The first variation of the test filters on an indexed column (state) and deletes those rows. The second test selects fewer rows, but filters on a column that does not have an index (zip) and deletes the rows.

Test 5a	**Delete 10,000 rows on an indexed column**
Test 5b	**Delete 5,000 rows on a non-indexed column**

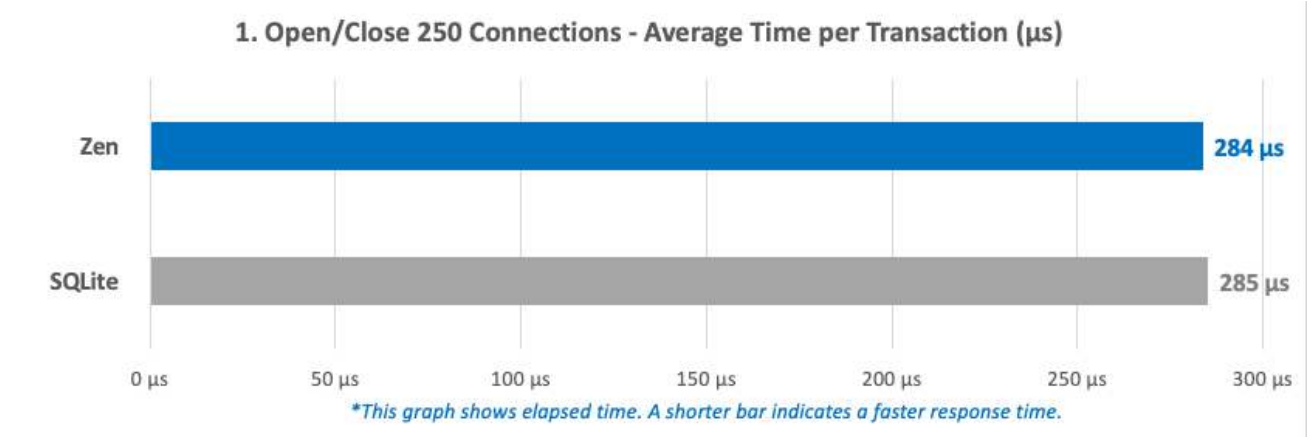
Benchmark Results

The following figures display the average time elapsed for each database transaction for both Actian Zen Edge and SQLite. Each test was executed 5 times and the median value was used.

Raspberry Pi

Test 1: Open and close 250 connections

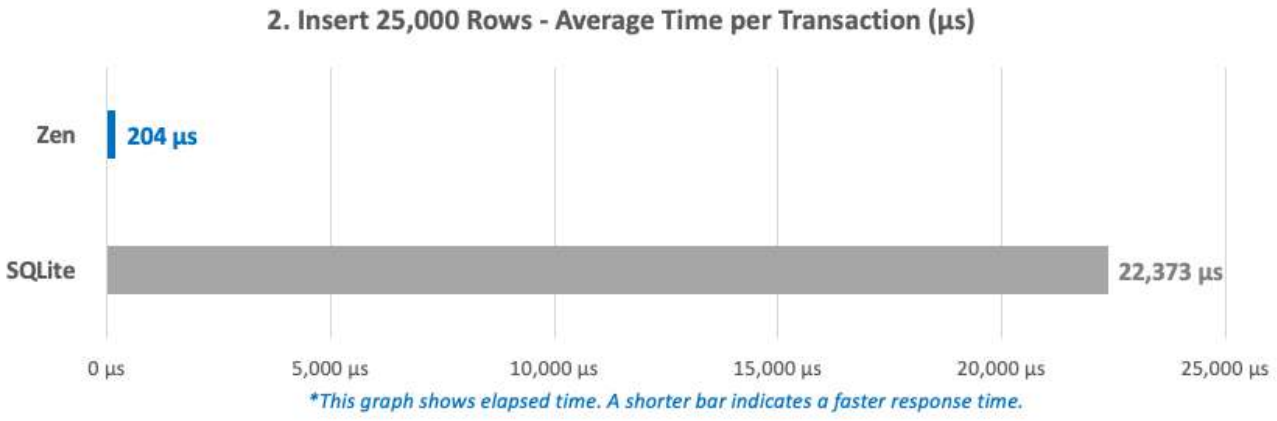
Below are the average times (in microseconds) it took to open and close a connection to the Actian Zen Edge and SQLite databases.



After 250 attempts, Actian Zen's average time to open and close a connection took .35% less time than SQLite.

Test 2: Insert 25,000 rows

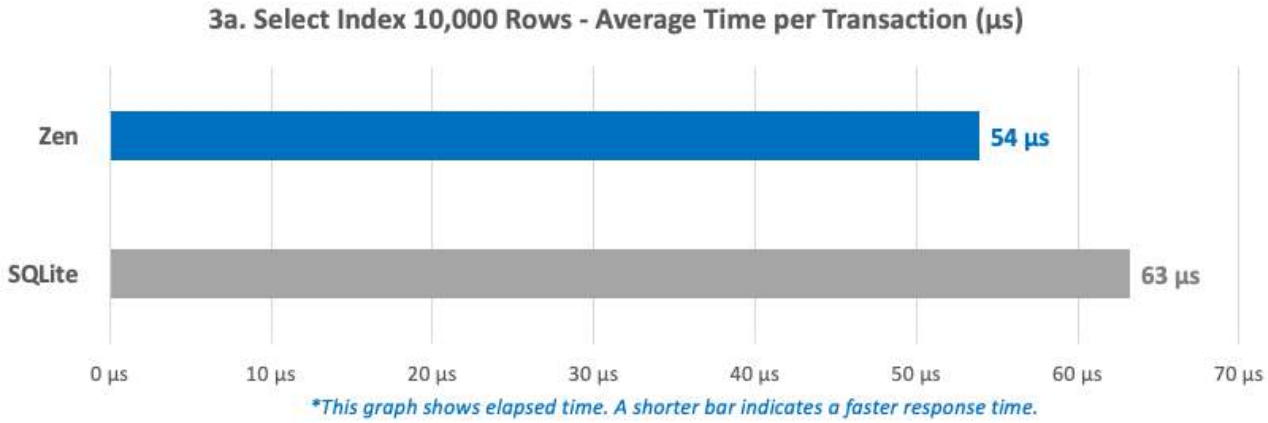
Below are the average times (in microseconds) it took to insert a complete row of randomly-generated data into the Contacts table on the Actian Zen Edge and SQLite databases.



This test revealed the first major performance differentiator. Actian Zen's average time to insert a single row (taking the average of all 25,000 inserts) was 110 times faster than SQLite inserts.

Test 3a: Select 10,000 rows on an indexed column

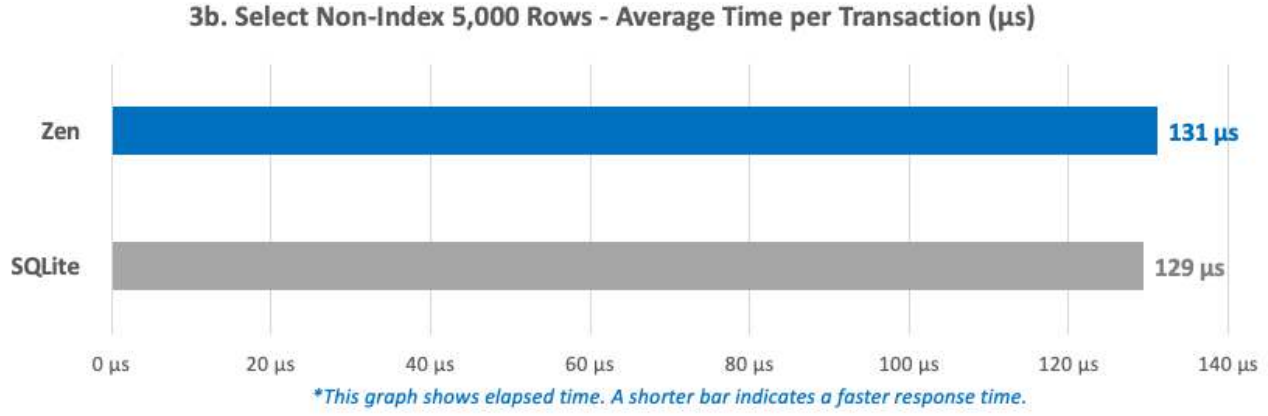
Below are the average times per row (in microseconds) it took to bulk select records from the Contacts table applying a filter on an indexed column for both the Actian Zen Edge and SQLite databases.



Both platforms responded very quickly. Actian Zen's fetch rate per row (taking the average of all 10,000 rows) took 15% less time than SQLite.

Test 3b: Select 5,000 rows on a non-indexed column

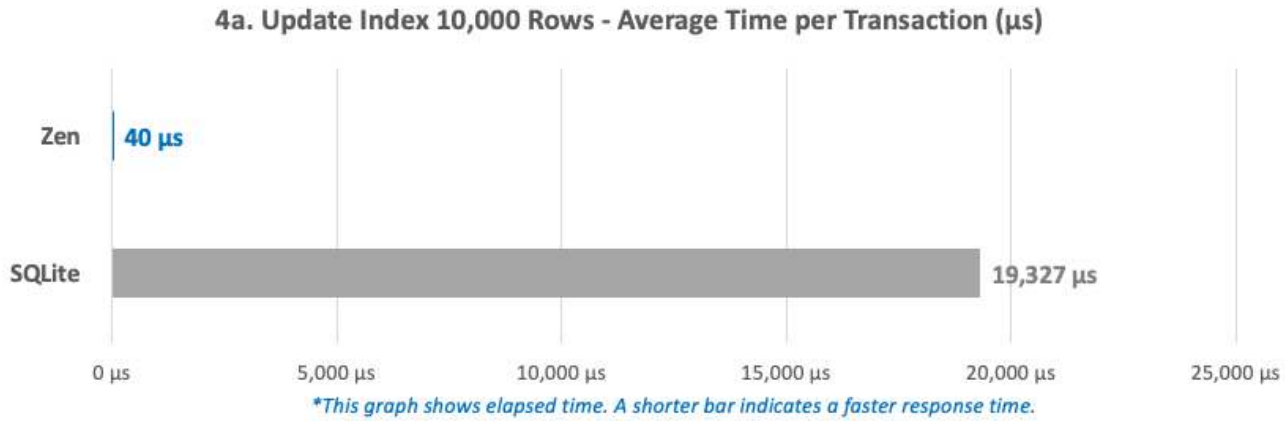
Below are the average times per row (in microseconds) it took to bulk select records from the Contacts table applying a filter on a non-indexed column for both the Actian Zen Edge and SQLite databases.



Again both platforms responded very quickly. Actian Zen's fetch rate per row (taking the average of all 5,000 rows) took 1% more time than SQLite.

Test 4a: Update 10,000 rows on an indexed column

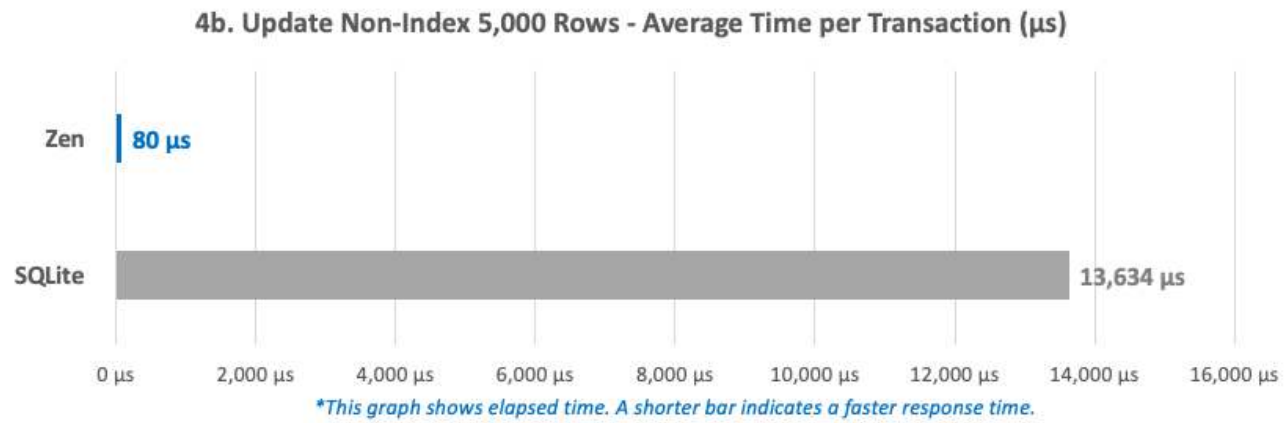
Below are the average times (in microseconds) it took to update a single column in the Contacts table applying a filter on an indexed column for both the Actian Zen Edge and SQLite databases.



Actian Zen's average time was so fast; it barely registers on this graph. Its average time to update a single column (taking the average of all 10,000 updates) was an impressive 483 times faster than SQLite updates.

Test 4b: Update 5,000 rows on a non-indexed column

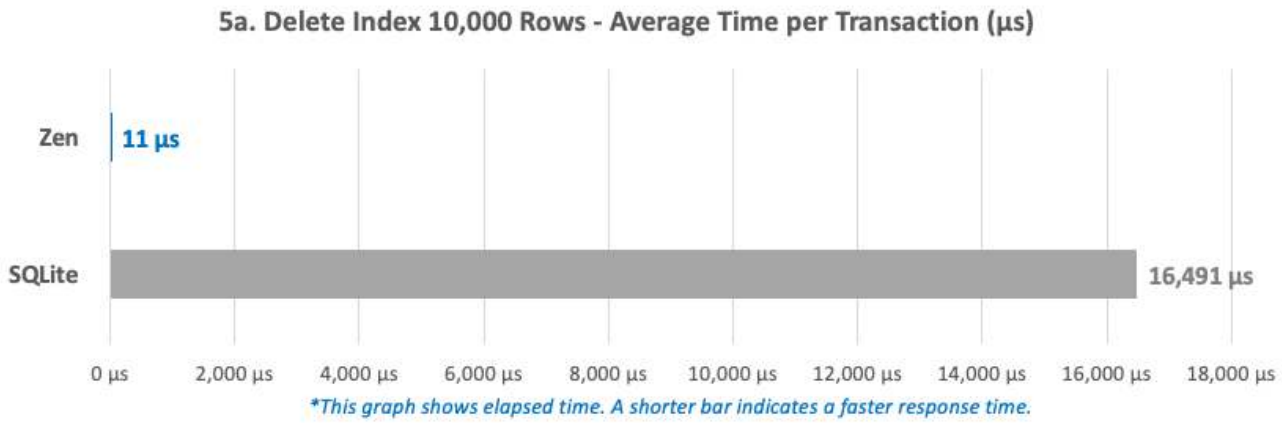
Below are the average times (in microseconds) it took to update a single column in the Contacts table applying a filter on a non-indexed column for both the Actian Zen Edge and SQLite databases.



This test had similar results as test 4a. Actian Zen's average time to update a single column (taking the average of all 5,000 updates) was 171 times faster than SQLite updates using the same filter.

Test 5a: Delete 10,000 rows on an indexed column

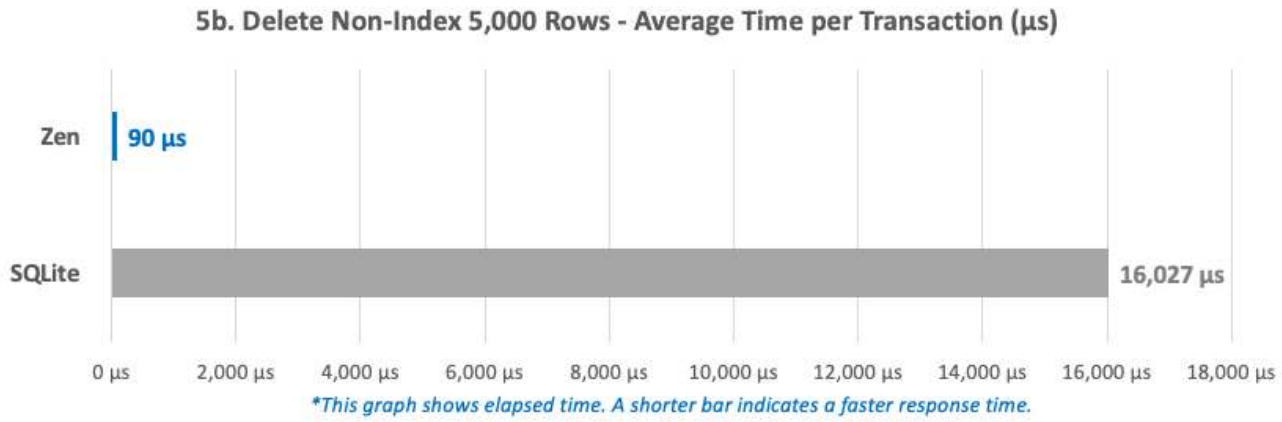
Below are the average times (in microseconds) it took to delete a row in the Contacts table applying a filter on an indexed column for both the Actian Zen Edge and SQLite databases.



Actian Zen was very fast. Its average time to delete a row (taking the average of all 10,000 deletes) was an overwhelming 1,499 times faster than SQLite deletes!

Test 5b: Delete 5,000 rows on a non-indexed column

Below are the average times (in microseconds) it took to delete a row in the Contacts table applying a filter on a non-indexed column for both the Actian Zen Edge and SQLite databases.

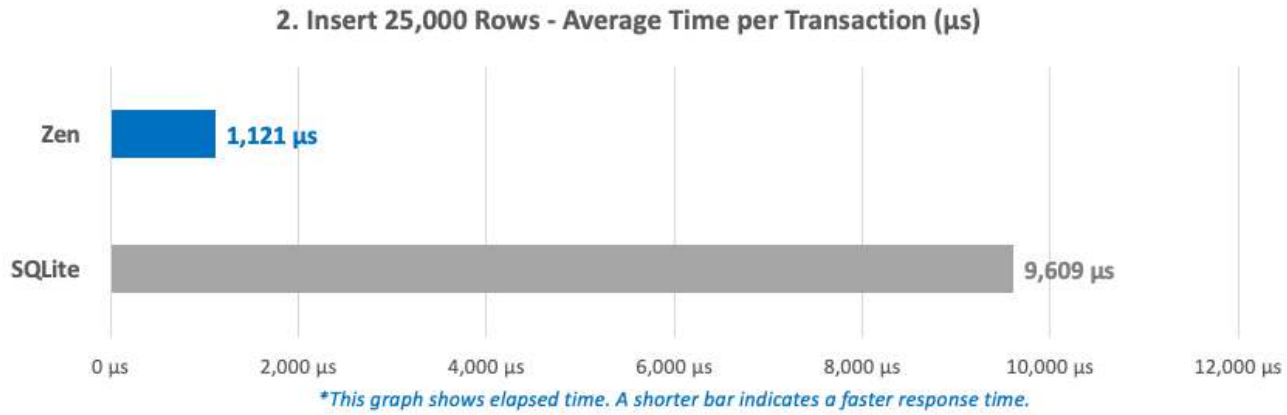


Deleting rows on a non-indexed column produced results consistent with before. Actian Zen's average time to delete a row (taking the average of all 5,000 deletes) was 179 times faster than SQLite updates using the same filter.

Android

Test 2: Insert 25,000 rows

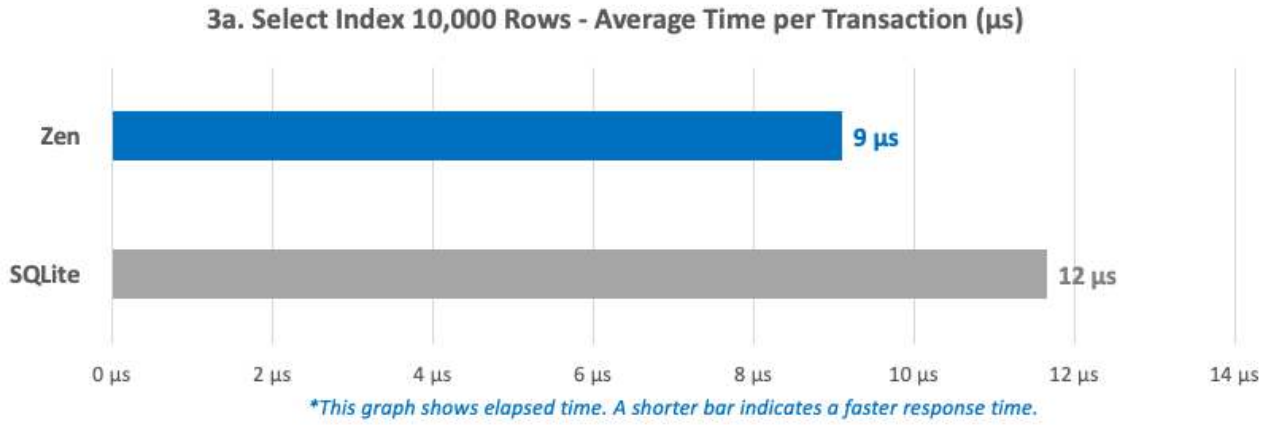
Below are the average times (in microseconds) it took to insert a complete row of randomly-generated data into the Contacts table on the Actian Zen Edge and SQLite databases.



This test revealed the first major performance differentiator. Actian Zen's average time to insert a single row (taking the average of all 25,000 inserts) was 8.6 times faster than SQLite inserts.

Test 3a: Select 10,000 rows on an indexed column – Android

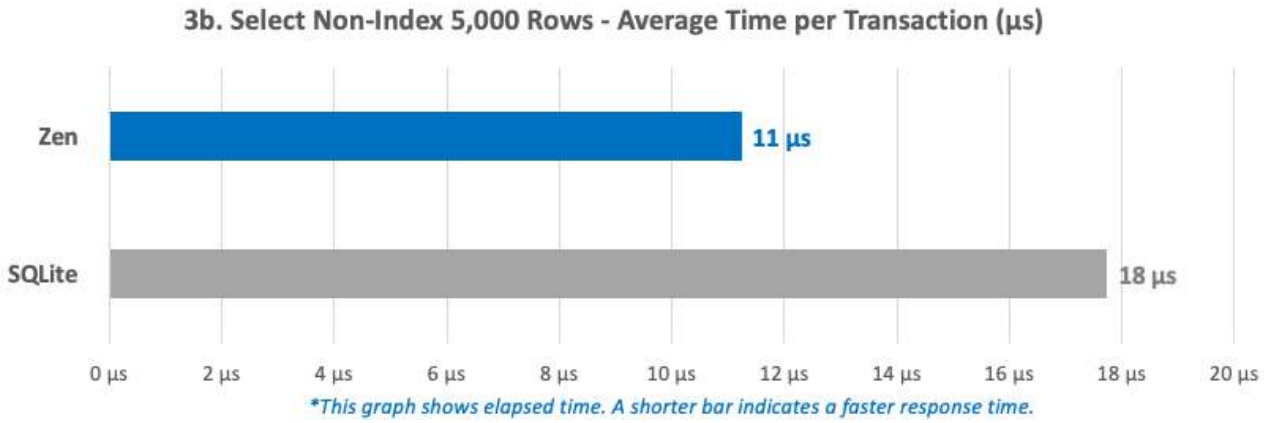
Below are the average times per row (in microseconds) it took to bulk select records from the Contacts table applying a filter on an indexed column for both the Actian Zen Edge and SQLite databases.



Both platforms responded very quickly. Actian Zen's fetch rate per row (taking the average of all 10,000 rows) was 1.3 times faster than SQLite.

Test 3b: Select 5,000 rows on a non-indexed column - Android

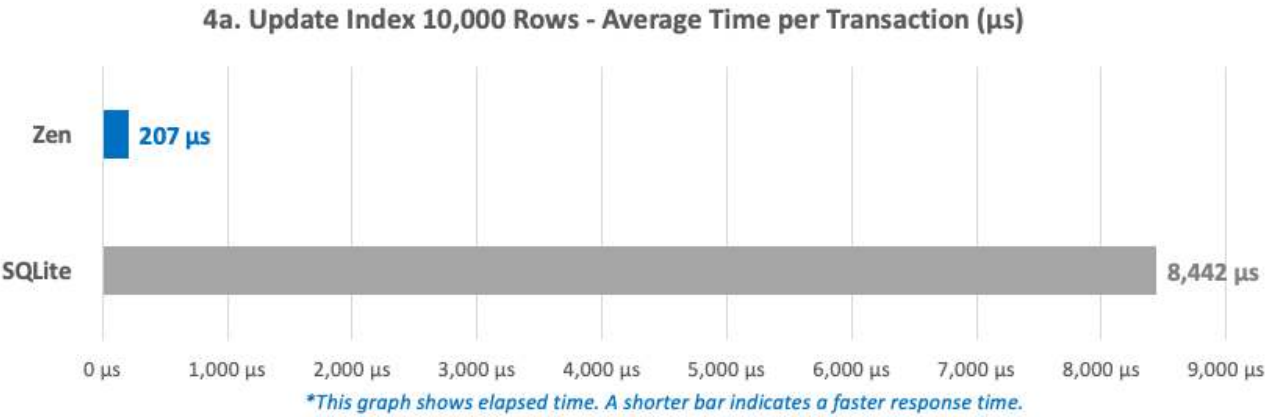
Below are the average times per row (in microseconds) it took to bulk select records from the Contacts table applying a filter on a non-indexed column for both the Actian Zen Edge and SQLite databases.



Again both platforms responded very quickly. Actian Zen's fetch rate per row (taking the average of all 5,000 rows) was 1.6 times faster than SQLite.

Test 4a: Update 10,000 rows on an indexed column - Android

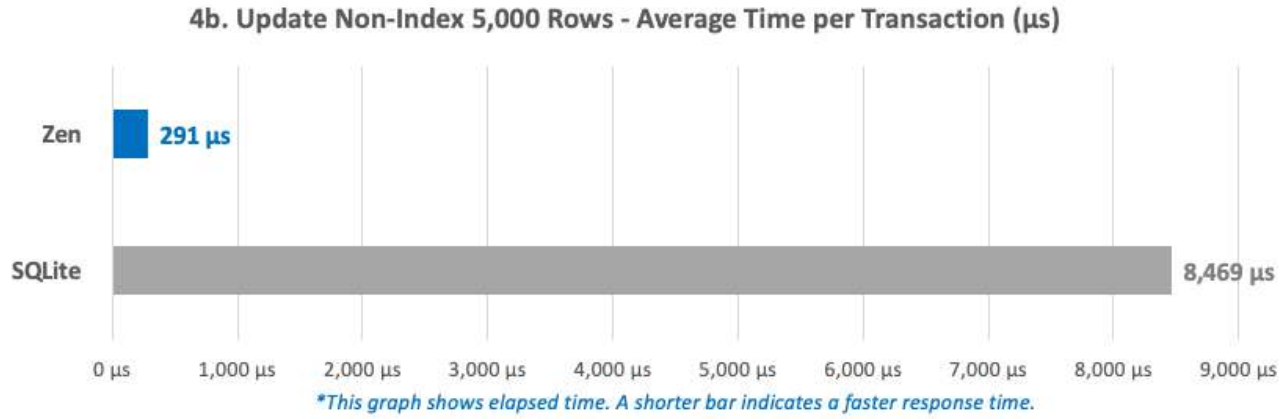
Below are the average times (in microseconds) it took to update a single column in the Contacts table applying a filter on an indexed column for both the Actian Zen Edge and SQLite databases.



Actian Zen's average time to update a single column (taking the average of all 10,000 updates) was 41 times faster than SQLite updates.

Test 4b: Update 5,000 rows on a non-indexed column - Android

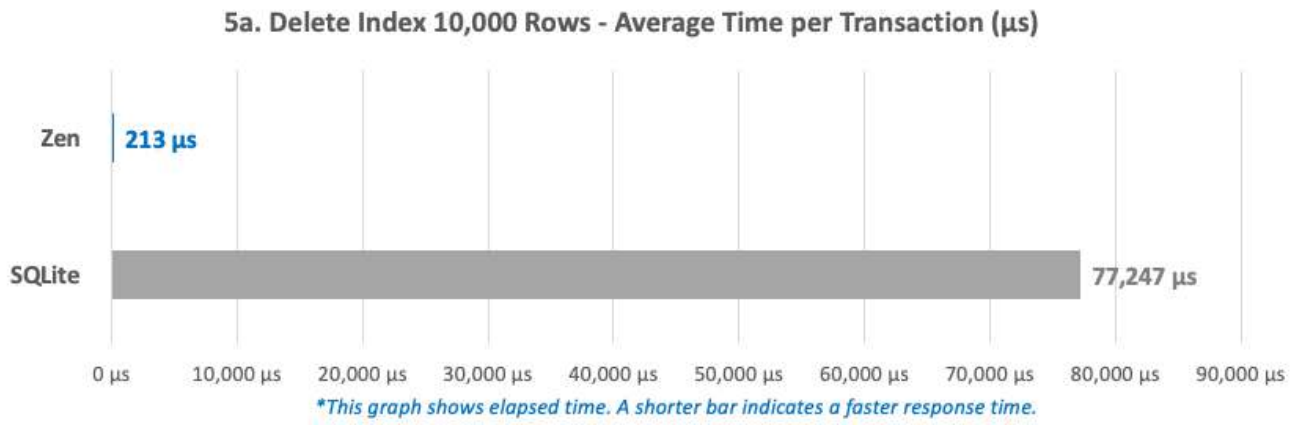
Below are the average times (in microseconds) it took to update a single column in the Contacts table applying a filter on a non-indexed column for both the Actian Zen Edge and SQLite databases.



This test had similar results as test 4a. Actian Zen's average time to update a single column (taking the average of all 5,000 updates) was 29 times faster than SQLite updates using the same filter.

Test 5a: Delete 10,000 rows on an indexed column - Android

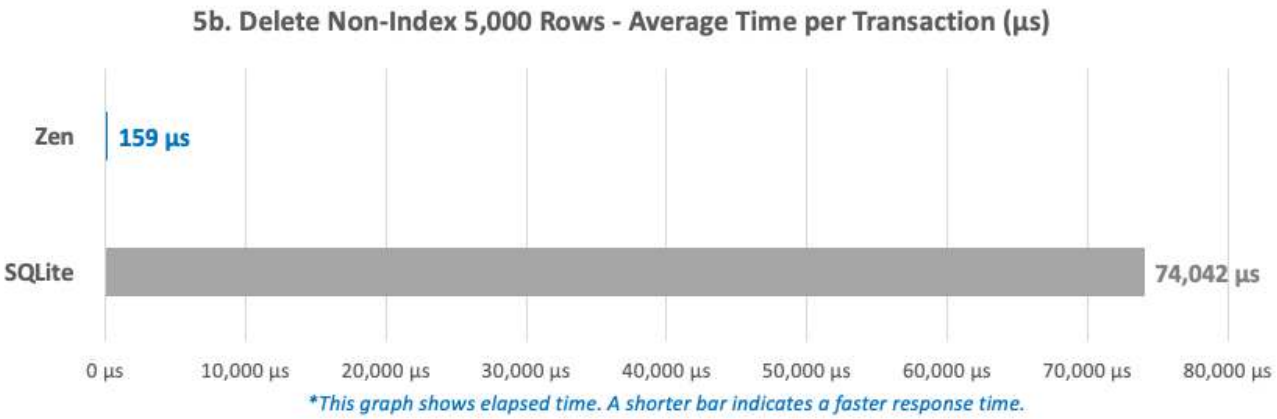
Below are the average times (in microseconds) it took to delete a row in the Contacts table applying a filter on an indexed column for both the Actian Zen Edge and SQLite databases.



Actian Zen was very fast. Its average time to delete a row (taking the average of all 10,000 deletes) was 363 times faster than SQLite deletes.

Test 5b: Delete 5,000 rows on a non-indexed column - Android

Below are the average times (in microseconds) it took to delete a row in the Contacts table applying a filter on a non-indexed column for both the Actian Zen Edge and SQLite databases.

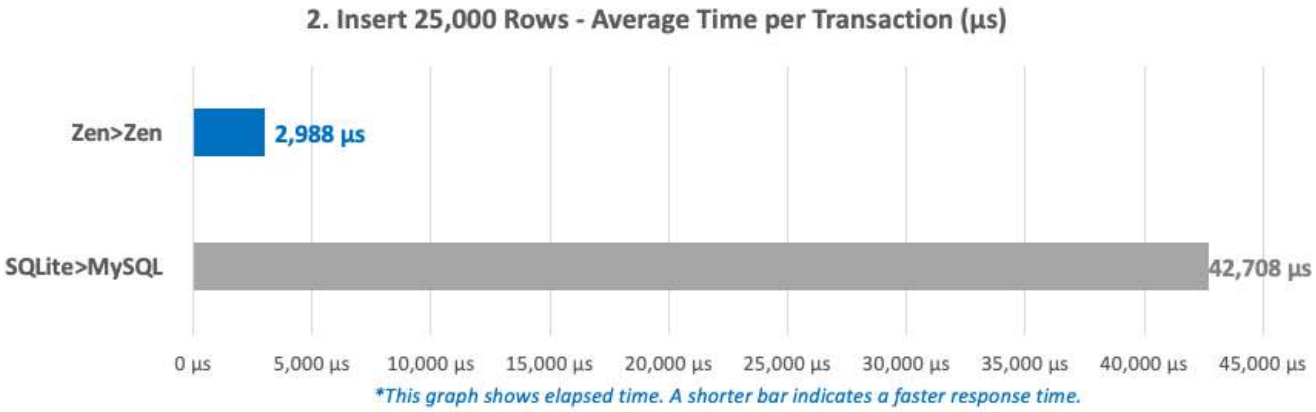


Deleting rows on a non-indexed column produced results consistent with before. Actian Zen's average time to delete a row (taking the average of all 5,000 deletes) was 465 times faster than SQLite updates using the same filter.

Synchronization

Test 2: Insert 25,000 rows and sync

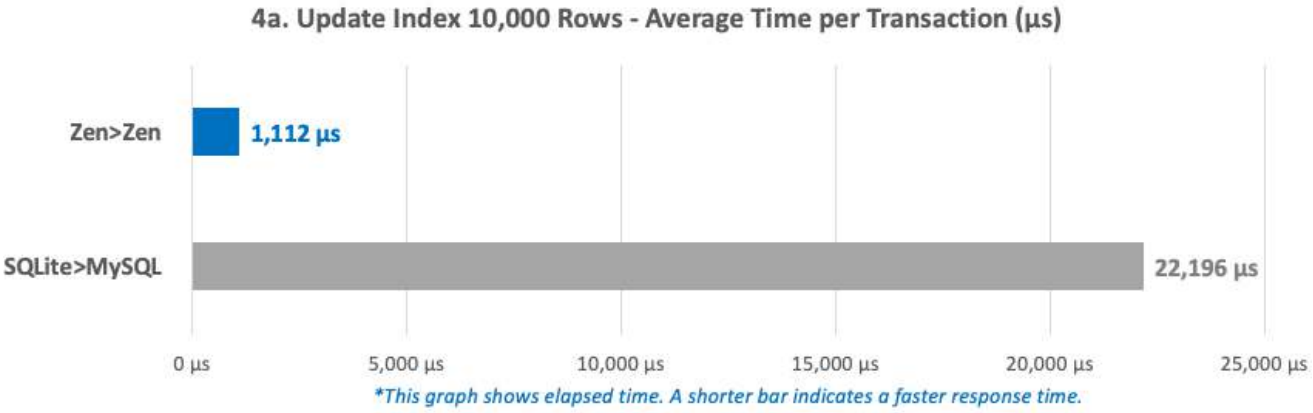
Below are the average times (in microseconds) it took to insert a complete row of randomly-generated data into the Contacts table on the Actian Zen and SQLite/MySQL Enterprise databases.



This test revealed the first major performance differentiator. Actian Zen's average time to insert a single row (taking the average of all 25,000 inserts) was 14 times faster than SQLite/MySQL Enterprise inserts.

Test 4a: Update 10,000 rows on an indexed column and sync

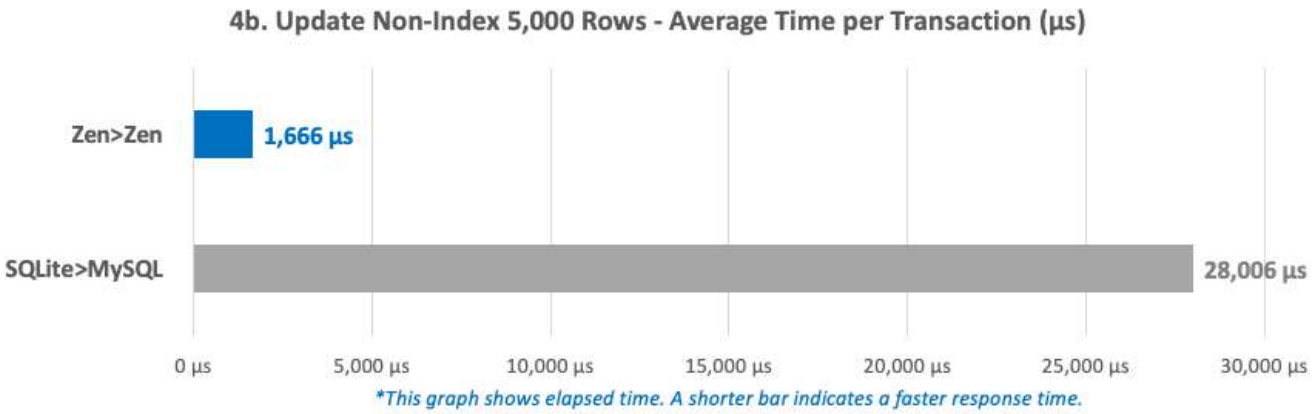
Below are the average times (in microseconds) it took to update a single column in the Contacts table applying a filter on an indexed column for both Actian Zen and SQLite/MySQL Enterprise.



Actian Zen's average time to update a single column (taking the average of all 10,000 updates) was an impressive 20 times faster than SQLite/MySQL Enterprise updates.

Test 4b: Update 5,000 rows on a non-indexed column and sync

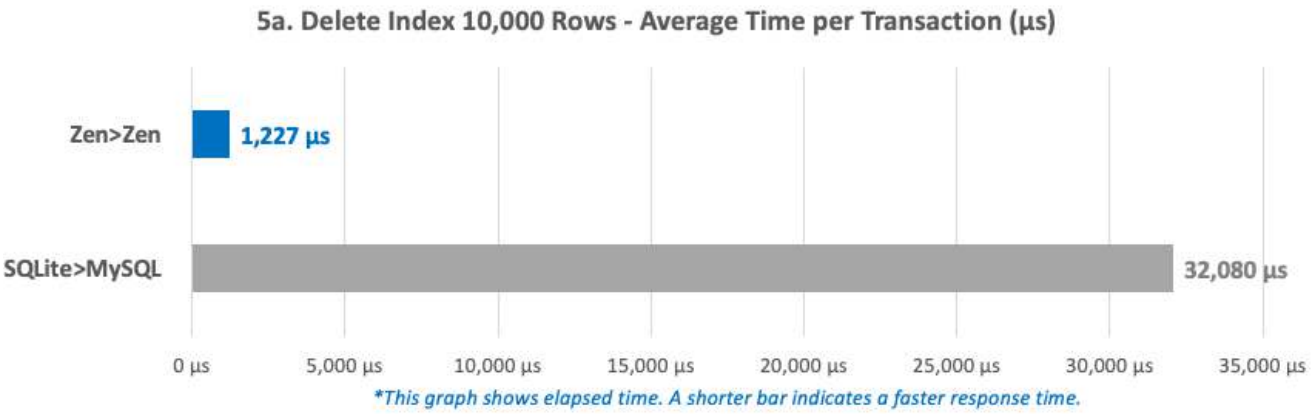
Below are the average times (in microseconds) it took to update a single column in the Contacts table applying a filter on a non-indexed column for both Actian Zen and SQLite/MySQL Enterprise.



This test had similar results as test 4a. Actian Zen's average time to update a single column (taking the average of all 5,000 updates) was 17 times faster than SQLite/MySQL Enterprise updates using the same filter.

Test 5a: Delete 10,000 rows on an indexed column and sync

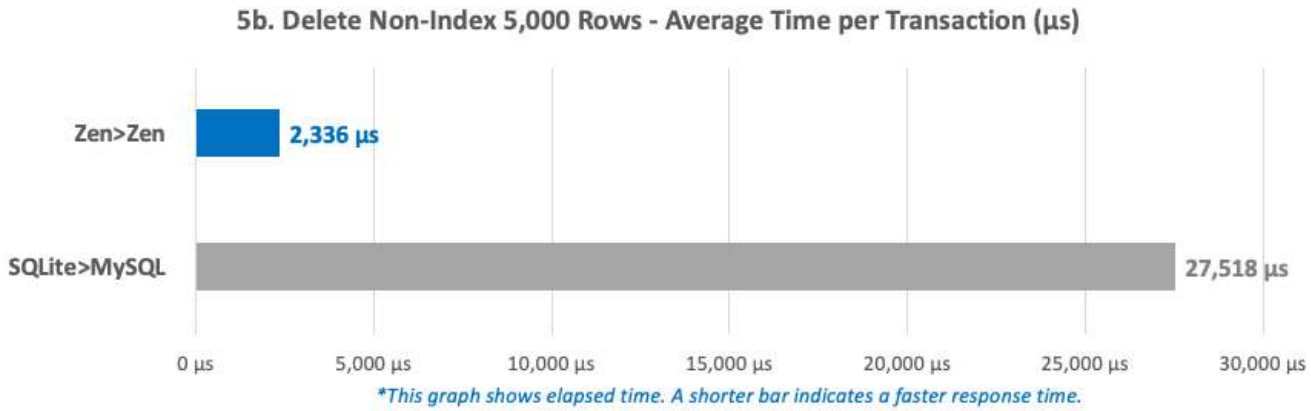
Below are the average times (in microseconds) it took to delete a row in the Contacts table applying a filter on an indexed column for both Actian Zen and SQLite/MySQL Enterprise.



Actian Zen was very fast. Its average time to delete a row (taking the average of all 10,000 deletes) was 26 times faster than SQLite/MySQL Enterprise deletes.

Test 5b: Delete 5,000 rows on a non-indexed column and sync

Below are the average times (in microseconds) it took to delete a row in the Contacts table applying a filter on a non-indexed column for both Actian Zen and SQLite/MySQL Enterprise.



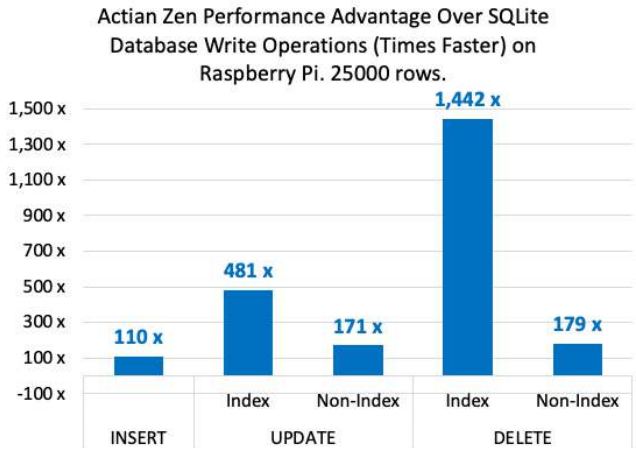
Deleting rows on a non-indexed column produced results consistent with before. Actian Zen's average time to delete a row (taking the average of all 5,000 deletes) was 12 times faster than SQLite/MySQL Enterprise updates using the same filter.

Conclusion

Actian Zen Edge outperformed SQLite in all of the fundamental database operations. These tested operations underlie nearly all operations that occur on an embedded database for an IoT or mobile implementation, so it is unlikely more complex operations would have a different result.

Overall, the benchmark results were insightful in revealing the query execution performance of Actian Zen Edge and SQLite revealing some of the differentiators in the two products.

Actian Zen Edge was faster across the board including the area where it tends to really matter in embedded databases—write speed. This is the essential performance metric for IoT data. Actian Zen Edge outperformed SQLite on Raspberry Pi by 110x on inserts, 1,442 on deletes with an index, and 481x on updates with an index.



Actian Zen Edge outperformed SQLite on Android by 9x on inserts of 25,000 rows, 41x on deletes of 10,000 rows with an index and 29x on deletes without an index, and 363x on updates of 10,000 rows with an index and 464x of rows without.

Zen Edge took about the same time as SQLite to open and close rapid connections on Raspberry Pi.

Actian Zen is a mature platform for embedded database applications with over 30 years of engineering and development behind it. The Btrieve 2 API had clear performance advantages without the overhead of SQL-bound SQLite. Also, Zen's Turbo Write Accelerator could also shed light into its performance advantages. Since it costs much less to continue writing than to stop and restart, contiguous writes are significantly faster than non-contiguous writes. The Turbo Write Accelerator (TWA) pre-allocates open slots within the physical file so that multiple pages can be written as a single coalesced page—improving I/O performance and reducing the overhead of interaction with the operating system.

The result of the application of the methodology to the architecture, both explained herein and replicable, shows a marked, and sometimes astonishing, performance advantage to Actian Zen Edge. This is especially true in the important write operations insert, update and delete.

Overall, Actian Zen is an excellent choice for IoT or mobile companies needing high performance and a scalable embedded database.

About McKnight Consulting Group

With a client list that is the "A list" of complex, sustainable and successful information management, McKnight Consulting Group (MCG) has broad information management market touchpoints. Our advice is an infusion of the latest best practices culled from recent, personal experience. It is practical, not theoretical.

We anticipate our customer's needs well into the future with our full lifecycle approach.
Our focused, experienced teams generate efficient, economic, timely and politically sustainable results for our clients.

- We take a keen focus on business justification.
- We take a program, not a project, approach.
- We believe in a model of blending with client staff and we take a focus on knowledge transfer.
- We engineer client workforces and processes to carry forward.
- We're vendor neutral so you can rest assured that our advice is completely client oriented.
- We know, define, judge and promote best practices.
- We have encountered and overcome most conceivable information management challenges.
- We ensure business results are delivered early and often.

MCG services span strategy, implementation, and training for turning information into the asset it needs to be for your organization. We strategize, design and deploy in the disciplines of Big Data, Data Warehousing, Analytic Databases, Master Data Management, Artificial Intelligence, APIs, MLOPs, Cognitive Search and Business Intelligence.

About Actian

Actian, the hybrid data management, analytics and integration company, delivers data as a competitive advantage to thousands of customers worldwide. Through the deployment of innovative hybrid data technologies and solutions Actian ensures that business critical systems can transact and integrate at their very best – on premise, in the cloud or both. For more information about Actian Vector and the entire Actian portfolio of hybrid data management, analytics and integration solutions on-premise or in the cloud, visit www.actian.com, and find more about Actian Vector for single servers and for Hadoop clusters, or get links to downloads for on-premise deployment or cloud instances.
