

Switching from Collibra **to Actian**

Reconsidering your data governance investments? Looking for an alternative? Let us help you in making an informed decision.

Why switch to Actian?

By switching to Actian, you are future proofing your data governance initiatives with a data intelligence platform that's easy to implement, intuitive to use, and delivers value in weeks, not years.

Active Metadata Management

Action's modern approach to active and automated metadata management capabilities replace Collibra's declarative approach.

Implementation

With Actian's highly automated implementation, it only takes weeks compared to Collibra's year-long setup.

Operating Costs

Action's native cloud/SaaS platform significantly reduces operating costs, lowering the total cost of ownership (TCO).

Metadata Harvesting

Action's built-in scanners and APIs enable connection to and synchronization of metadata from metadata collection across.

Metamodeling and Search

Action's knowledge graph technology provides flexible metamodeling and powerful contextual search capabilities.

Short Time-to-Value

With Actian, business and IT teams can focus on revenue-generating projects, not just regulatory/compliance use cases.

Adoption and Usage

Action's intuitive UX/UI drives immediate adoption and usage across technical and business users.

Data Knowledge

Action's native integrations and APIs supports comprehensive data knowledge including usage, quality, privacy, governance, and more.

Your 6-Step guide to seamlessly switch to Actian

We work closely with your team or partner every step of the way, providing guidance, support, and expertise to ensure a successful migration to Actian.

1 Framing

Framing the migration project involves analyzing the current situation to define a target for the migration and identifying functional or organizational perimeters that will enable a gradual opening of Actian's solution.

2 Migration

During the metadata migration process, the work previously done in Collibra is not thrown away but rather reused and simplified to accelerate the transition to Actian. The migration process is based on a 4-step process:

- 1. Inventory and analysis:** Identification of the elements related to the pilot's perimeter, validation of their value to decide whether to migrate them, and rationalization of the concept if migration takes place⁽¹⁾.
- 2. Preparing:** The identified elements are exported in a simple structured format, such as CSV, to ease the next step.
- 3. Transposition:** Implementation of the metamodel defined in the analysis phase into Actian Data Intelligence Platform to receive the exported information, adaptation of the structure of the file for each type of element to conform to the target model, and configuration of the connections to related source systems⁽²⁾.
- 4. Loading:** Converted data can be loaded into Actian for validation through a technical check to ensure complete migration (via random sampling or through Actian APIs). Technical assets connected during the adaptation stage can be loaded into Actian Data Intelligence Platform using a different mode called Scanner.

3 Pilot Launch

A pilot launch to targeted user groups serves three main objectives:

- a. Introduction and familiarization** with Actian's data catalog and apps for both user and contributor populations,
- b. Presentation of the migrated elements**, their new representation, and browsing opportunities brought by Actian's knowledge graph,
- c. Awareness-raising** about the next step, which aims to identify potential optimizations.

4 Feedback Gathering and Optimization

During the pilot phase, user experimentation is crucial for collecting feedback on the data in the catalog. The project team can then identify measures to improve the quality of the information, such as structural modifications to represent certain concepts differently (metamodel). These improvements are modeled, presented, validated, and implemented.

(1) This step is the best opportunity to challenge the existing assets to be migrated and measure, through feedback, the possible limits. The analysis also allows Actian to make assumptions about the metamodel adapted to the need by retaining only the characteristics that really bring value.

(2) Actian allows for bulk import via simple structured files, making the operation efficient and streamlined. Its connected nature enables the automated feeding of certain metadata, mostly declarative in Collibra.

5

Next Perimeter Planning

Based on the experience gained during the pilot, the next phase or phases can be planned. Their number will depend on several factors, including: the scope of the migration, the desired execution speed, and the potential for parallelization if multiple teams can validate different scopes simultaneously. Actian's team / or partner can evaluate the migration context and propose the most appropriate organization.

6

Iteration on Step 2

An incremental migration allows for adjustments to be made as the migration process progresses, making the exercise simpler.

The execution of the next steps follows the same process as during the pilot phase.

Migration options

To achieve a successful migration to Actian, we offer various options to meet your unique needs.

Led by Actian

Our experienced team will help you frame your migration project and assist you throughout the process – from defining your metamodel, configuring our scanners and APIs, to mastering the solution's key concepts and UX/UI, and more.

Led by Partner

A partner will provide expert guidance on your migration journey, from recommending an overall solution design and setting it up, to teaching and training your teams to support the system. Contact us if you'd like to access the Actian Partner Network directory and find a trusted partner to meet your unique needs.

Hybrid migration

Actian provides guidance on best practices and recommends an overall solution design. You and your partner will be responsible for executing specific project activities and completing the remaining work.

“

We chose to switch from Collibra to Actian for three main reasons. Firstly, unlike Collibra, we were impressed by Actian's ability to connect instantly to our data sources without needing to rely on third-party tools. Indeed, connecting to modern data platforms often requires customization, and Actian was able to meet our connectivity needs. Additionally, we were impressed by Actian's Bottom Up approach, which allowed us to democratize data access. In contrast, Collibra's Top Down method was more conceptual and complex, involving the use of workflows that we deemed unnecessary and hindered democratization.

Finally, when comparing the TCO of both solutions – including subscription and implementation costs – Actian proved to be a much more cost-effective option than Collibra.”

GROUPE BPCE

Michel Lunetta,
Product Owner, Data Management
Solutions, Groupe BPCE

Provide a modern data discovery experience for your teams by switching from Collibra to Actian.

Action Data Intelligence

Find, trust, and unlock the value of your organization's data. As the central governance system for your organization's data access and accelerates all your data-driven business initiatives. The platform, the Action Data Intelligence Platform enables effective discovery, governance, and utilization of data assets through a modern cloud-delivered solution.
